Elements

Active Elements - Sources

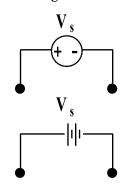

Voltage Source:

≻Ideal:

- Maintains constant voltage irrespective of connected load
- \circ Internal resistance $R_s = 0$

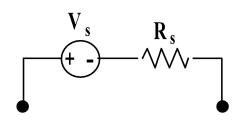

Ideal Voltage Source (DC)

> Practical:

- Terminal voltage changes based on the connected load
- o Internal resistance R_s ≠ 0

Practical Voltage Source

Active Elements - Sources

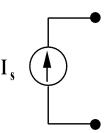

Current Source:

Ideal Current Source (DC)

≻Ideal:

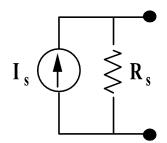

- Maintains constant current irrespective of the load connected
- Internal resistance $R_s = \infty$

▶Practical:

- Output current changes based on the connected load
- o Internal resistance R_s < ∞

Practical Current Source

Resistor

Energy Consuming Element

Resistor

- Passive electric device that dissipates energy
- > Resistance: property which opposes flow of current
 - Symbol: R
 - \circ Unit: Ohms (Ω)
 - \circ Power Consumed = I^2R

- **≻**Conductance
 - Reciprocal of resistance
 - Symbol: G
 - Unit Siemens (S)

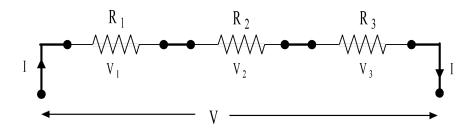

Resistors in Series

Current (I) is same

$$V = V_1 + V_2 + V_3$$

$$R_{eq} = R_1 + R_2 + R_3$$

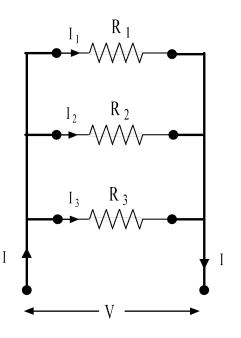

Resistors in Parallel

Voltage (V) is same

$$I = I_1 + I_2 + I_3$$

$$\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

Inductor

Energy Storing Element

Inductor

- ➤ Passive electric device that stores energy in its magnetic field when current flows through it
- A coil of wire wound on a core
 - Eg.: Air core Inductor, iron core inductor

- ➤ Inductance: property which opposes rate of change of current
 - Symbol: L
 - Unit: Henry (H)

The voltage across inductor is proportional to the rate of change of current through it

$$v_L = L \frac{di}{dt}$$

Inductive Circuit

For a coil uniformly wound on a **non-magnetic core** of uniform cross section, self inductance is given by

$$L = \frac{\mu_0 A N^2}{l}$$

Where,

l = length of the magnetic circuit in meters

A =cross sectional area in square meters

 μ_o = Permeability of air = 4×10^{-7}

N = No.of turns in the coil

Equivalent Inductance

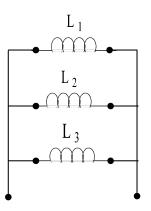

Inductors in series

$$L_{eq} = L_1 + L_2 + \dots + L_n$$

Inductors in Parallel

$$\frac{1}{L_{eq}} = \frac{1}{L_1} + \frac{1}{L_2} + \dots + \frac{1}{L_n}$$

Energy Stored in an Inductor

Instantaneous power,

$$p = v_L \cdot i = L i \frac{di}{dt}$$

 \triangleright Energy absorbed in 'dt' time is

$$dw = L i di$$

➤ Energy absorbed by the magnetic field when current increases from 0 to I amperes, is

$$W = \int_0^I L i \, di = \frac{1}{2} L I^2$$

Capacitor

Energy Storing Element

Capacitors

- Passive electric device that stores energy in the electric field between a pair of closely spaced conductors
- Capacitance: Property which opposes the rate of change of voltage
 - Symbol: C
 - Unit: Farad (F)
- The capacitive current is proportional to the rate of change of voltage across it

$$i_c = C \frac{dv_c}{dv_c}$$

 $i_c = C \frac{dv_c}{dv_c}$ ightharpoonup Charge stored maintained at c

$$o = cv$$

Terminologies

Electric field strength,

$$E = \frac{V}{d} volts/m$$

Electric flux density,

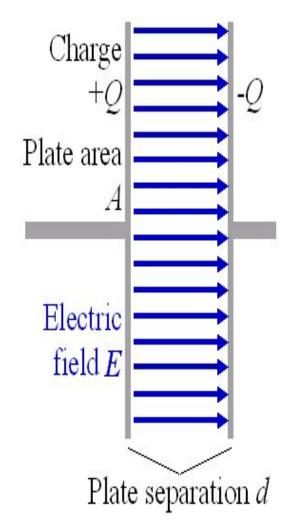

$$D = \frac{Q}{A} C/m^2$$

Permittivity of free space,

$$\varepsilon_0 = 8.854 \times 10^{-12} \, F/m$$

- \triangleright Relative permittivity, $arepsilon_r$
- Capacitance of parallel plate capacitor

$$C = \frac{\varepsilon_0 \varepsilon_r A}{d}$$

Equivalent Capacitance

Capacitors in Series

$$\frac{\mathbf{1}}{\mathbf{c}_{eq}} = \frac{\mathbf{1}}{\mathbf{c}\mathbf{1}} + \frac{\mathbf{1}}{\mathbf{c}\mathbf{2}} + \dots + \frac{\mathbf{1}}{\mathbf{c}\mathbf{n}}$$

Capacitors in Parallel

$$C_{eq} = C_1 + C_2 + \dots + C_n$$

Energy stored in a Capacitor

➤Instantaneous power

$$p = v_c \times i = C v_c \frac{dv_c}{dt}$$

Energy supplied during 'dt' time is:

$$dw = C v_c dv_c$$

 \triangleright Energy stored in the electric field when potential rises from ${f 0}$ to ${f V}$ volts is,

$$W = \int_0^V C v_c dv_c = \frac{1}{2}CV^2$$
 Joules

Illustration 1

- a) 15 resistors are connected as shown in the diagram. Each of the resistors has resistance 1 Ω . Find the equivalent resistance of the network between A & B.
- b) What will be the equivalent resistance of this network if the resistors arranged in the sequence extends to infinity?

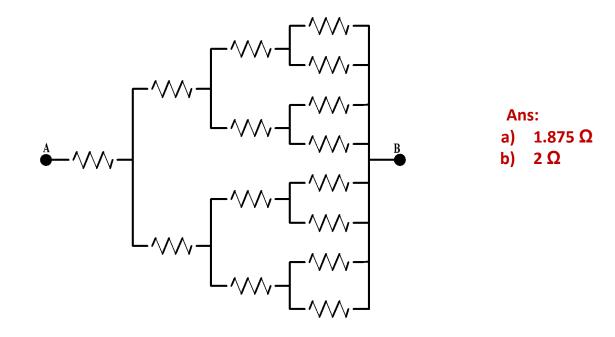

Illustration 2

Two incandescent bulbs have the following ratings:

Bulb-1: 120 V, 60 W; **Bulb-2:** 240 V, 480 W

- a) Both of them are connected in series with a voltage source.
 - i. Which bulb will glow brighter and why?
 - ii. What is the maximum voltage that can be applied so that non of the bulbs fuse?
- b) Now both of them are connected in parallel with a voltage source.
 - i. Which bulb will glow brighter and why?
 - ii. What is the maximum voltage that can be applied so that non of the bulbs fuse?

Assume that the incandescent bulbs are purely resistive.

Ans:

- a) i) Bulb-1 since it consumes more power, ii) 180 V
- o) i) Bulb-2 since it consumes more power, ii) 120 V

Illustration 3

Two incandescent bulbs of 40 W and 60 W ratings are connected in series across the mains. Then which of the following statement(s) is (are) correct?

- a) The bulbs together will consume 100 W
- b) The bulbs together will consume 50 W
- c) The 60 W bulb glows brighter
- d) The 40 W bulb glows brighter

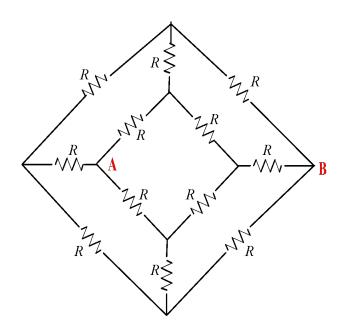

Assume the voltage rating of both the bulbs to be same.

Ans: d) The 40 W bulb glows brighter

Homework 1

Reduce the network to its equivalent resistance between terminals A and B

Ans: $\frac{5}{6}$ R
